

# Scenario 3 – Feedback Sentiment Router

Sharman Mahesh Rawat

*n8n Hackathon Screening Submission — SharmanRawat\_Scenario3*

---

## Section 1: Problem Statement

College event coordinators collect feedback after every workshop, hackathon, or guest lecture. The real problem starts after the form closes—someone has to read every single response. They have to figure out if it's a compliment, a genuine complaint, or an urgent safety issue, then decide exactly who to email and what to say back. When you get a couple hundred responses per event, it eats up hours. By the time they reach row 150, coordinators are skimming instead of reading, and real problems get buried in the pile along with all the "great event!" messages.

I built this workflow to remove that manual sorting step. It watches the feedback sheet in real-time, sends each new row to an AI model for classification, and routes the response automatically. Positive feedback gets stored as a testimonial, urgent negative feedback triggers an alert email to the coordinator, and anything ambiguous or mixed gets flagged for a human review. The coordinator only spends time on the complaints that actually matter.

## Section 2: Workflow Diagram

## Section 3: Node-by-Node Explanation

**Google Sheets Trigger:** Automatically fires the workflow the moment a new student feedback row is added to Sheet1.

**Validation + First Switch:** Prevents empty, too-short, or pure gibberish entries from reaching the AI—saving API costs and routing them straight to the review sheet.

**Backup Original Data:** The HTTP node only returns the AI's response and deletes the original input. This node saves a safe copy of the student's name, email, and event before the API call.

**Delay:** Adds a 2.5-second pause between rows. This prevents the AI provider (Groq) from throwing a rate-limit error when processing multiple rows at once.

**HTTP Request (AI Node):** Sends the raw feedback text to Groq's API using llama-3.3-70b-versatile. The model classifies the sentiment, assigns an urgency score, and returns a structured JSON object.

**Parser:** Cleans the AI's raw response, parses it into valid JSON, and stitches it back together with the original student data we saved earlier.

**JavaScript2 + Switch1 (Router):** Looks up the correct coordinator email based on the AI's category (e.g., Technical -> IT, Venue -> Facilities), then routes the row into one of four branches based on the sentiment and urgency score:

**Testimonials:** Logs the row to a Testimonials sheet and sends a "We loved it!" email to the student.

**High Priority Email:** Sends the coordinator an [URGENT] email with an action plan, while simultaneously sending an auto-reply to the student.

**Action Items:** Sends a normal-priority email to the coordinator, appends the row to an action sheet, and auto-replies to the student.

**Needs Review:** Appends mixed, neutral, or low-confidence feedback to a manual review sheet so a human can handle it later.

## Section 4: AI Component (Decision Point)

---

The actual decision-making in this workflow happens inside the HTTP Request node—not in any downstream "if/else" rules. The raw feedback text is sent to Groq with a strict system prompt defining an exact JSON schema. The LLM then determines if the feedback is Positive, Negative, Neutral, or Mixed, selects a specific category (like Technical, Venue, or Speaker), and calculates an urgency score from 1 to 5 based on the severity of the complaint. It even generates a custom action\_item and a drafted reply for the coordinator to use.

This beats simple keyword matching. A rule like "contains the word 'refund' -> negative" breaks the moment a student writes a mixed review like "the workshop was great, I just wish there was a refund policy for no-shows", or uses sarcasm like "oh great, another Wi-Fi outage". The model reads the sentence for actual meaning instead of scanning for trigger words, which lets it pick up nuanced tone that a keyword list would completely miss.

## Section 5: Sample Output

---

### Output 1: High-Priority Coordinator Alert

AI scores this 5/5 urgency, files it under Technical, and drafts a coordinator-ready reply — no manual editing needed.

## Output 2: Student Auto-Reply (Testimonial Branch)

AI generates a warm, on-brand reply automatically, with no coordinator involvement.

## Output 3: Data Routing & Storage (Testimonials Sheet)

The workflow doesn't just send emails—it also automatically routes and stores the structured data into the correct Google Sheet tab. Below is the row appended to the Testimonials sheet for the same positive feedback shown in the auto-reply above.

| Feedback Data                                           |               |                       |                |                                                                                              |                                                                  |           |          |  |

Not all feedback falls neatly into "Positive" or "Negative". The AI identifies ambiguous, mixed, or neutral responses and safely routes them to the Needs Review sheet instead of risking a misclassification. This ensures that sarcasm, mixed praise-and-complaint reviews, or generic "it was okay" feedback don't accidentally trigger an urgent email to the coordinator.
